

Create a new project folder to build a skeleton for your portfolio site. Please name your folder as [lastName]Portfolio.

Inside your folder, you should include three HTML files (index.html, about.html, contact.html), one CSS file (stylesheet.css).

- Your stylesheet MUST be linked in the head of your html files, there should be no inline styles written on the HTML page.
- You should also have the proper meta tags to account for different screen sizes.

The HTML of your site should include:

1. Headers on each of the pages with your name in it.
2. A p tag on the home page with a welcome message about yourself.
3. Three images on your home page (wireframes included)
4. A navigation on all pages that links to your home, about, and contact pages.
5. Your contact page should include an HTML5 form with two inputs and a textarea for contacting you. It should also include a submit button.
6. An ordered list of facts about yourself on the about page.
7. An unordered list of your favorite books or bands on the about page.
8. 1 external link
9. Proper tabbing for nested columns

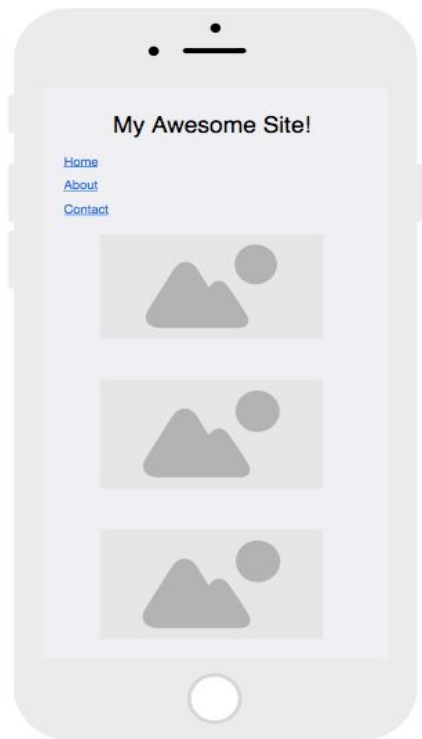

The CSS of your site should include:

1. Hover states on all links that change color when hovered.
2. Center your site's header on the page.
3. Import at least two external fonts. Use one on the body as your default font and one for the header.
4. Use border-radius on your images.
5. Use box-shadow on your images.
6. Center the form on the contact page.
7. Put a border around the form and use padding to create space between the border and the form's content.
8. Inputs inside the form should have spacing between them.
9. Media queries that change the layout of the navigation and images to reflect the wireframes below.
10. Use flexbox on your images and links to accomplish the required responsiveness.

Responsiveness wireframes:

Please note - wireframes are **not** a design, they are the basic layout showing how your links and the images should be structured at mobile vs. desktop view. Read more about wireframes [here](#). This means that your styling should include different background colors, fonts, font colors, and images, etc. This is your opportunity to be creative!

Mobile (default styles)

Tablet/Desktop (styles should apply @ browser width of 768px)
